Abstract (en)

[origin: WO03099055A1] The invention relates to a piece of jewellery for fastening in a pierced body part, comprising a first part (100) with a first geometrical shape, which first part has a first end (110) and a second end (120), where at least the first end (110) has an opening, which piece of jewellery also comprises a second part (200) with a first end (202) and a second end (204), where the second part has, in the direction towards its first end (202), a first portion (210) which is designed so that part of this first portion can be arranged in the opening in the first end (110) of the first part. The first part and the second part are held together to form a connected piece of jewellery by virtue of interaction between the first part and the second part, during which interaction the first part (100) and the second part (200) remain two mutually separate parts where the first portion of the second part can run essentially freely in the opening of the open first end (110) of the first part, and the connected piece of jewellery has a stop arrangement (120, 220) in order to prevent the piece of jewellery coming away from the pierced body part.
