Abstract (en)  
[origin: WO03099689A1] Unit loads (1) can be transported on an area having a certain length and width, the area for example being the bottom of a standardized container or a loading compartment of a railway goods wagon. In order to improve the filling rate and to obviate damages to the transported goods, the respective lengths and widths of the unit loads to be transported are adjusted to together correspond to the length and width of the area. Further, each unit load is placed on two or more loading ledges (5), each ledge comprising an L-shaped profile having projections (7) for supporting the unit load at a certain distance over its support and being positioned at a lower edge of the unit load.
