Abstract (en)
[origin: WO03106317A1] A folding cylinder (01) comprises a number of flexible strips (02), retained in at least two positions (11, 12) on the body of the folding cylinder (01), whereby at least one first position (12) of said positions may be displaced in the circumferential direction of the folding cylinder (01) for circumference adjustment, at least one rail (31) which may be displaced in the axial direction of the folding cylinder (01) and means (21, 29) for translation of the axial displacement of the rail (31) into a movement of the first position (12) of the strips (02) in a circumferential direction. The rail (31) is pressed against an axially adjustable stop ring (37, 39) which is coaxial to the body of the folding cylinder (01).
