Abstract (en)

[origin: WO2004001157A1] The invention relates to a panel element comprising an active side, a counter-traction side located opposite the active side, a first longitudinal side comprising an elastic tongue, and a second longitudinal side which is opposite the first longitudinal side and comprises a groove that is shaped in a complementary manner to the elastic tongue. Said elastic tongue comprises a first projection (21) which protrudes past the active side in a first direction which is parallel to the active side and normal in relation to the longitudinal direction of the elastic tongue. The inventive panel element also comprises a second projection (22) which extends in the first direction, a first undercut (23) being formed between the first projection (21) and the second projection (22). At least one first region (25) of the second projection (22) is closer to the tongue-side edge (18) of the active side (11) than a second region (26) of the first undercut (23).
