Abstract (en)

[origin: FR2841075A1] Device comprises a plurality of peripherals (Pa, Pb, Pc, Pn), a central control unit (4) and a communications network (5) connecting them together. The central control unit has one or two transmission controllers (41, 42) connected to the various peripherals through a transmission channel (50), each transmission controller comparing context codes (Ka, Kb, Kc, Kn) received from the peripherals with stored reference codes (Ra, Rb, Rc, Rn) to set a security circuit (6) in a security or fault configuration, dependent on whether the compared codes show identical one-to-one correspondence.
