Abstract (en)
[origin: EP1515289A1] A user interface for a control station of a security system, in particular a danger management system, comprises a display screen (12) for the indication of events in the system and means for the treatment of the indicated events by an operator. The display screen (12) is segmented into three areas, a first area (13) which represents the summary of the events in the system, a second area (14) representing an event list comprising information about the displayed events in a symbolic form, and a third area (15) which can be used for any application useful for the operation of the control station. The first and the second area (13, 14) cannot be covered by other windows. The display screen (12) is dynamically segmented such that a permanent overview over events is preserved even when a detailed view of a single event is active. <IMAGE>
