Abstract (en)
[origin: WO03091026A1] The invention relates to a cylinder (01) for a rotary printing machine, the circumferential surface thereof comprising at least two adjacent, cylindrical sections (07, 08) which are separated by an interlying recess (09). Said recess can be closed by a detachably fixed insertion element (11, 12) in order to form a continuous outer surface. The insertion element consists of a plurality, especially two, insertion parts (11, 12), the circumferential surfaces thereof completing a cylindrical circumferential surface once the insertion parts have been arranged in the recess. The invention also relates to a device comprising separating elements (31) for using with one such cylinder.
