Abstract (en)

[origin: WO03106235A1] The invention relates to a method and a device for influencing the driving behaviour of a vehicle in such a way as to increase the driving stability and thus the driving comfort for the driver of the vehicle. This is achieved by triggering at least two systems in the vehicle, which improve the driving behaviour and the driving stability. The essence of the invention lies in the fact that a system is triggered in a pre-determined order according to the triggering and/or the effect caused thereby on the driving behaviour of the above-mentioned systems. A chassis system is triggered first of all, followed by a steering system and then a braking system.
