Abstract (en)

[origin: WO2004001257A1] The invention relates to a sealing arrangement (10) for sealing a gap between two components (12, 16) which can rotate in relation to each other about a common rotational axis (18), comprising a brush seal (22) which is securely arranged in a first component (12 or 16) and co-operates with a sealing surface (32) of the second component (16 or 12). The invention is characterised in that the sealing surface (32) is embodied as a cone, whereby at least one component (12 or 16) can be axially displaced or adjusted in relation to the other component (16 or 12).
