Abstract (en)  
A louvre system comprises at least one louvre (1), elongate carriers (2) and securing means (3) for securing the louvre to in each case one of the carriers, in such a manner that the louvre is oriented transversely with respect to the carriers, which securing means comprise a holder (5) and a support (6), provided with convexly or concavely curved series (10,16,17) of uniform elevations (11) and recesses (12) which alternate at regular intervals with one another, which series can be made to interact with one another in different angular positions in order to define different angles between the louvre and the carrier, as seen in a plane which is defined by the cross section of the louvre and the longitudinal direction of the carrier. One of the series comprises at least two subseries, and there are also means for influencing the distance between these subseries with a view to fixing the louvres in place. <IMAGE>
