Abstract (en)

[origin: WO03102165A2] A chimeric, carboxy-terminal truncated hepatitis B virus nucleocapsid protein (HBc) is disclosed that is engineered for both enhanced stability of self-assembled particles and the display of an immunogenic B cell or T cell epitope, or both, such as a B cell epitope polypeptide of the influenza M2 protein and a T cell epitope of the influenza NP protein. An immunogenic epitope is peptide-bonded to one or more of the N-terminus, in the immunogenic loop or at the C-terminus of HBc, whereas the enhanced stability of self-assembled particles is obtained by the presence of at least one heterologous cysteine residue near the amino-terminus of the chimer molecule. Methods of making and using the chimers are also disclosed.
