Abstract (en)
[origin: WO2004074577A1] Disclosed are prepgs which can be obtained by impregnating a raw paper with a thermally crosslinkable impregnation combination, and methods for the production thereof. The impregnation combination contains a thermally crosslinkable, formaldehyde-free resin solution and a polymer dispersion. The mixing ratio between the resin solution and the polymer dispersion in the impregnation combination ranges between 45:55 and 10:90 (solid:solid). After drying, the prepg has a degree of crosslinking of no less than 10 percent but no more than 85 percent and a residual moisture of 2 to 3 percent by weight. The inventive prepgs are provided with better properties than previously known formaldehyde-containing and formaldehyde-free prepgs regarding printability and surface bonding strength (ripping resistance) as early as the moment the prepgs leave the paper machine while maintaining great surface density (great ability to receive lacquer) and dimensional stability/flatness.
