Abstract (en)

[origin: US2005069366A1] In an arrangement to generate a print image for franking and postmarking machines a control unit electronically controls a printer and storage unit for data that are printed in predetermined sections of the print image. Controlled by the electronic control unit, a selected section is printed with special postal information by the printer in a second position to the left next to a first position. The special postal information characterize a private mail carrier. The electronic control unit of the device is connected with a mail processor that determines data that enable mail piece processing and sorting at the private mail carrier.
