Abstract (en)

[origin: WO2004002397A1] The invention relates to a baby's bottle comprising: a bottle body (1) with a first end (1a), which is configured for the attachment of a teat (2) and a second end (1b), which has an opening (3); a base element (4) comprising a base (4a), which has at least one ventilation opening (4b), whereby the base element (4) can be connected to the bottle body (1) in such a way that the base (4a) covers the opening (3) of the bottle body (1); and an inset element (5) consisting of an elastic material, which when in use is placed between the opening (3) of the bottle body (1) and the base (4a) of the base element (4). The inset element (5) has a protuberance (5a) comprising a slit opening (5b), said protuberance (5a) being configured as a hollow sphere section.
