Abstract (en)

A device for fixing a tubular buoyancy chamber to a hull, particularly for inflatable watercraft and the like, comprising a first plurality of loops (11) rigidly coupled to the sides of the hull, a second plurality of loops (12) distributed along the tubular buoyancy chamber (7), and an elongated retention element (13), which is adapted to be inserted alternately in each one of the loops respectively of the first and second pluralities (11, 12) and to be fixed to the hull (3) at mutually opposite first and second ends (14, 15), so as to retain the tubular buoyancy chamber (7) adjacent to the side (6). <IMAGE>
