Abstract (en)

The present invention can prevent a liquid from scattering and enable yarn splicing to be reliably accomplished. A yarn splicing device has a twisting member 31 which twists yarn ends by injecting compressed air to which a liquid is added, against the yarn ends, and a shielding mechanism 61 which covers a periphery of the twisting member with no loads imposed on the yarns, the shielding mechanism being open to an exterior in its part corresponding to a yarn path, the shielding mechanism regulating a scattering direction in which the compressed air and liquid used for twisting. The shielding mechanism 61 has a twisting shielding member 62 which prevents the compressed air and liquid from scattering toward a front surface, and a base member wall shielding member 63 which prevents the compressed air and liquid from scattering toward a unit frame (Fig.1). <IMAGE>
