Abstract (en)

[origin: WO2004016987A1] The invention relates to a pore burner, especially for cooking appliances, comprising a housing provided with at least one inlet for a gas/air mixture as a fuel and/or at least one inlet for air and/or at least one inlet for gas and/or at least one outlet for air and/or gas and/or waste gases. Said housing comprises at least one dimensionally stable, porous moulded body consisting of sintered metallic powder and/or an especially pressed metallic wire mesh, on the surface of which and/or in the pore spaces of which are reaction zones for the flame development for forming a surface burner. The invention also relates to a pore burner comprising at least one distribution device for the targeted orientation of part of the gas and/or air flow and/or part of the gas/air mixture flow, said distribution device being at least partially arranged and/or moulded in the hollow body in such a way that part of the air and/or gas flow or part of the gas/air mixture flow can be distributed such that the inner wall of the hollow body, especially in the region of the distribution device, has a non-homogenous pressure distribution.
