Abstract (en)

[origin: EP1524631A2] A device and a process for monitoring an industrial facility are specified which afford the persons working there the maximum possible protection in which sensors (4, 5) are attached to persons (2, 3) or moving objects and which send or trigger a code relating to a person or moving object, there are position markers (31, 32, 33, 34, 41, 42, 61, 62, 71, 72, 36, 37, 74) at entrances and exits of an industrial facility (21, 22) which provide a position code and a direction code for the passage of an entrance or exit and receivers (15, 35, 43, 63, 73) to receive the sensor's code in combination with the position and direction code. A computing and analysis unit (12) is connected to the receivers and designed to generate a topology of the entry into or exit from the industrial facility by the persons or moving objects.
