Abstract (en)

[origin: US2005173160A1] The invention relates to the combination of a balance and a cash register with a customer display device shared by both, customary cash register software being used for this purpose. A multiplexer is used, the one data input of which has weighing data of the balance applied to it and the other input of which has price and/or product data that are output by the data processing unit applied to it, the one data input being activated by a multiplex switching signal when the weighing data have a value other than zero.
