Abstract (en)

[origin: WO03088124A2] A centralized rules repository maintains consistently expressed rules used to process patient claim data in supporting medical procedure eligibility verification, patient referrals, treatment authorization, data entry editing, electronic claim submission, claim status determination and electronic remittance processing. A system for managing rules used for processing claim data related to provision of healthcare to a patient includes an interface processor for acquiring data representing rules from a plurality of different sources. The system includes a rules repository for accumulating data representing acquired rules and a rules processor for initiating application of a selected rule derived from the repository to process claim data in response to a received message. A result processor processes a result being derived by the application of the selected rule to the claim data for output. The interface processor also transforms acquired rules to a common syntax suitable for storage in the rules repository.
