Abstract (en)

[origin: DE10349912B3] The mounting to control the movement of an automobile side window, at the side door, has a motor within the side door which raises the window pane (5) from a lowered position into an intermediate setting (ZP) when the side door is closed. This ensures that the upper edge (22) of the window is at least partially within the gap (15) between the lips (13,14) of the window seal (12) at the door parapet.
