Abstract (en)
[origin: WO2004020057A1] According to the invention, an electronic device, in particular a games device may carry out a number of differing functions, in particular games functions, in a simple and economical manner, whereby the device comprises a main module (1) and at least one sub-module (2) which may be plugged into the above. The sub-module (2) comprises a circuit (13), which, in cooperation with a further circuit (5) in the main module (1), trains the device to carry out a function specific for each sub-module (2) and whereby the circuit (13) in the at least one sub-module (2) is embodied as an organic circuit. The sub-module (2) may be selected from a number of different types of sub-modules each with different circuits for different functions.
