Abstract (en)

[origin: DE10321999A1] The method involves using a control voltage for the actuator that depends on at least one internal combustion engine operating parameter, e.g. the interval between a first partial injection and a second partial injection or a fuel temperature and/or actuator temperature value. The voltage for controlling the second partial injection can depend on the fuel quantity delivered during the first partial injection. AN Independent claim is also included for an arrangement for driving an actuator.
