Abstract (en)  
[origin: EP1528210A2] Device for adjusting a structural body, especially a window frame (1), in a building opening comprises an adjusting element (2) consisting of a bolt (4) mounted so that it can be axially displaced in a sleeve (5) fixed on the structural body and extending in a receiving bore (8) in the structural body. The bolt is rigidly connected to a support element (3) on a side facing away from the structural body. The sleeve has on a side facing the support element outside the structural body a radial bore (13) with an internal thread so that it can engage with a radially displaceable threaded pin (7) to axially fix the bolt. Preferred Features: The free end (14) of the threaded pin has a tool holder (15).
