Abstract (en)

[origin: WO2004014007A2] A method (900) of and apparatus for effecting a handoff from a first Internet Protocol (IP) connection (221) to a second IP connection (331) is disclosed. The method includes: communicating a packet data communication between a first station and a gateway using the first IP connection and a first IP address for the first station, the gateway relaying the packet data communication with a second station; setting up the second IP connection with a second IP address for the first station, the first IP connection being a primary connection and the second IP connection being a secondary connection between the first station and the gateway, determining that the second IP connection should be the primary connection between the first station and the gateway; and changing the second IP connection to the primary connection by informing the gateway that the second IP address is the primary address using stream control transmission protocol (SCTP) messages.
