Abstract (en)

A window (1) with an opening of the tilttable type for railway carriages wherein the tilttable portion (3) is hinged to the surround (5) of the window by means of a pair of aligned and axially sliding pins (12a, b) so as to define a first position, wherein they are engaged in housings (24) integral with the surround, and a second position wherein, following axial translation one towards the other, they are disengaged therefrom. The tilttable portion is also hinged, parallel to the pair of pins, to an intermediate cross member (11) of the window integral with the surround so that, when the pins are in the first position, the tilttable portion can only perform an angular movement of preset extent after the locking means (4) have been disabled manually, whereas, when they are placed in the second position, the tilttable portion rotates in relation to the cross member until it is fully tipped, the locking means being disabled after lowering of the tilttable portion as a result of disengaging of the ends of the pins from the respective housings. <IMAGE>
