Abstract (en)

[origin: US2005252400A1] A dressing is guided onto a cylinder of a printing machine. At least one roller element is used to accomplish this dressing guidance. A support, which includes spaced first and second ends, is provided. The first end of the support is connected to a cross-piece that is running along parallel to an axis of rotation of the cylinder. The at least one roller element is situated on the second end of this support. The support is an elastically flexible body. An actuator is arranged between the cross-piece and the support. The actuator is operable to move the roller toward or away from the cylinder by flexing the elastic support.
