Abstract (en)
[origin: WO2004005658A1] A doorframe element for a door, window or the like, including a profile element (1) and a heat insulating material (21), which expands when heated and which is arranged at the profile element, wherein at least one through opening (23) is arranged in a first wall section (10) of the profile element, adjacent to the expanding insulating material for allowing the insulating material to expand through the opening. In order to enhance the ability to prevent heat transfer through the doorframe element, the opening (23) and the insulating material (23) are arranged so that the insulating material, partially or fully, takes up a space which is formed between the first and a second wall section of the profile element when the insulating element expands.
