Abstract (en)

[origin: WO2004005895A1] The invention provides a system (100) and methods for in-situ identification of one or more regions of tissue (138) at which there is a likelihood of disease. The invention generally relates to methods and devices for acquiring, analyzing, processing, and displaying optical data and diagnostic results from a patient sample. For example, methods of the invention comprise obtaining spectral and visual data from a patient sample, calibrating the data, compensating for sample motion, arbitrating between redundant data sets, identifying potentially non-representative data, analyzing the data, and displaying the diagnostic results. The invention provides the option of real-time data processing and diagnosis.
