Abstract (en)
A container for food products comprises two half-shells (2, 4) which can be fitted together mouth to mouth and each of which defines a respective containing chamber (18, 24) for receiving a food product (M) or an accessory (G), respectively. The two half-shells (2, 4) are connected to one another by form-fit connection means (6, 8, 12); one (2) of the half-shells, which defines the chamber (18) for receiving the food product (M), is closed by means of a sealing foil (16) that is applied to its mouth profile and the other half-shell (4), which defines the chamber (24) for containing the accessory (G), is closed by means of a transverse partition (26) which is associated with the wall (10) of the half-shell (4) by form-fit means in a position set back relative to the mouth end of the half-shell (4). <IMAGE>
