Abstract (en)

[origin: EP1533248A1] The device has a case with a slide (6) that moves between reentry and exit positions with respect to a cover (5). The cover has a driving unit (10) to apply a contact pressure on a stack of products in the slide, when the slide is displaced towards a reentry position. The slide and driving unit are similarly configured in order to prevent the contact of the driving unit with the stack, when the slide is placed in the reentry position. Independent claims are also included for the following: (A) a method of fabrication of a products distribution device (B) a method of distribution of products.
