Abstract (en)

[origin: WO2004018322A1] The device comprises a collar-shaped cassette body (1), including a central opening (2) surrounded by an open-top annular space which is divided by partitions (4) for dosage containers (3). The dosage containers (3) are concealed by a cover (11), rotatable relative to the cassette body (1) and provided adjacent to its circular rim with a dispensing aperture (13), which is coincident with any dosage container (3) by rotating the cover (11). The cover (11) includes a central recess (12) or a collar ring, which is fit to be embedded in the body's central opening (2). The cover (11) is provided with a window (14), through which is visible a dispensing time for at least one dose, which is printed on a dispensing schedule placed in the body's central opening. Cooperation between the body (1) and the cover (11) enables facilitating both dispensing of doses from the dosage containers and loading of medicaments into the dosage containers.
