Abstract (en)  
[origin: WO2004023606A1] The invention relates to a lead-through terminal comprising a terminal housing (1), which is made of insulating material, at least one metallic outer conductor connecting body (3), which is placed inside said terminal housing (1) or which projects out of the terminal housing (1), and comprising at least one metallic inner conductor connecting body (4), which is partially placed inside the terminal housing (1), partially projects out of the terminal housing (1) and which is electrically connected to the at least one outer conductor connecting body (3). The terminal housing (1) can be elastically fastened inside an opening of a housing wall (9) or the like only from one side by using fastening elements (21) integrated inside the terminal housing (1). This design enables the lead-through terminal to be fastened, for example, from the outside to the housing wall (9) of an electrical device without requiring additional fastening means inside the housing.
