Abstract (en)
[origin: WO2004011109A1] A wheeled board (1) for carrying a rider holding on to a kite for propulsion. The board has a support platform (2) on which the rider stands, and wheel sets (3, 4) attached at either end of the board. A pair of foot retaining straps (18, 19) are provided on the support platform, spaced longitudinally from each other, the arrangement being such that each foot of a rider will be located laterally asymmetrically with respect to the longitudinal axis (5) of the board with a bias towards the side of the longitudinal axis of the board on which the heels are positioned. The support platform is laterally asymmetrical, with the major part (13) of the support platform being on the heel side. On the heel side, the support platform has a profile which is generally convex, and on the other side of the longitudinal axis the support platform has a profile with a region (15), extending generally between the positions of the toes of a rider, which is concave.
