Abstract (en)  
[origin: WO2004028857A1] The invention relates to a cushion with a cushion core, particularly made of a foam material, and with an air- and moisture-permeable covering layer that encloses said core. The aim of the invention is to improve the climate comfort by effecting a good removal of moisture from the intermediate area between the covering layer and the cushion core. To this end, interspaced longitudinal and transversal grooves are shaped into the surface of the cushion core that is covered by the covering layer. These grooves are open up to the covering layer and intersect one another. In addition, the cushion core is provided with channels that pass through the entire thickness of the core. Said channels lead to the points of intersection of the longitudinal and transversal grooves as well as to the exterior of the cushion core.
