Abstract (en)
[origin: WO2004026718A1] Disclosed is a container for flowable materials such as pastes (2), liquids (3), i.e. materials that have the shape of the container receiving said materials but have a proper volume. The inventive container comprises a hollow body (1) receiving the flowable material (2, 3), an inlet and outlet port (4) for the flowable material (2, 3), and a sealing element (5) which can be connected to the hollow body (1) so as to prevent the flowable material (2, 3) from discharging. The inventive sealing element (5) is provided with a plurality of different openings (6), each of which can be closed and opened individually and independently of the other openings (6) by means of a separate closure or separate cap (7) such that the flowable material (2, 3) can be discharged from the hollow body (1) also via any single opening (6).
