## Abstract (en)

[origin: WO2004023233A2] The present invention provides a method, a network device and a system for allowing for resuming a preceding incomplete synchronization session is provided, wherein the preceding incomplete synchronization session has been interrupted during its performing. In principle the resuming of the preceding incomplete synchronization session is based on the following operations according to the inventive concept. A communication connection for synchronization of data between a first and a second device is established. The first and the second device comprise each a predefined set of data records to be synchronized. A first and a second update identifier are communicated between the first and the second device. The first update identifier specifies a preceding complete synchronization session having been performed between them and the second update identifier specifies a preceding incomplete synchronization session having been performed between them. Synchronization related information is exchanged between the first and the second device.
