Abstract (en)

[origin: EP1541754A1] A liquid-permeable support (1) as or for a paper machine clothing that is usable in the press section of a paper machine, has  $\geq 2$  plies (2, 3) that brace against one another via discrete bracing components, where at the points where the plies brace against one another, there is applied on one or both sides, an elastic coating (12, 13), which is embodied elastically, such that the spacing of the plies under pressure loading is decreased. A liquid-permeable support as or for a paper machine clothing that is usable in the press section of a paper machine, has  $\geq 2$  plies that brace against one another via discrete bracing components (4-9), where at the points where the plies brace against one another, there is applied on one or both sides, an elastic coating, which is embodied elastically, such that the spacing of the plies under pressure loading is decreased by elastic compression of the coating, and upon pressure relief is increased again by elastic recovery of the coating.
