Abstract (en)

[origin: CA2500975A1] Disclosed is a method for machining a blank or semi-finished product (1) of a future optical element, particularly an eyeglass lens, according to which the blank or semi-finished product (1) is retained by a receiving device (3) on a surface (5) so as to allow the free face of the blank or semi-finished product (1) to be machined. The receiving device (3) is inserted into a holding device. A bonding connection is introduced between the blank or semi-finished product (1) and the receiving device (3), the receiving device (3) being adapted to the radius of the surface (5) of the blank or semi-finished product (1), which is connected to the receiving device (3).
