Abstract (en)
Waste introduced into a waste bin assembly (4) of a refuse vacuum system (1) when the system is in an active phase, is held back therein during such an active phase, is then discharged from the assembly when the system is in a non-active phase and is removed by the refuse vacuum system in connection with a nextcoming activation thereof. By controlling emptying of the waste bin assemblies in this manner handling of the smaller amounts of waste from the bin assemblies will not interfere with the operation of the main refuse collection and will not add to the noise level or the total active time of the system. <IMAGE>
