Abstract (en)

[origin: EP1544884A1] The breaker has an electronic circuit examining an electric signal between supply and distribution terminals (3, 4), to send a tripping order to an actuator when a predefined situation is identified. A reset allowing part is moved, when the actuator trips the breaker based on the order, such that the breaker is reset by pushing the part before pushing a push-button (1) or by simultaneously pushing the part and button.
