Abstract (en)

[origin: WO2004031858A2] The invention relates to a resist system for lithography methods for the production of semiconductor components at wavelengths of 0.1 -150 nm, characterised by at least one polymer or copolymer comprising at least one acid-labile group. The invention also relates to the use of a resist system and a lithography method, whereby it is possible to obtain high sensitivity, especially in the EUV range, and no limitation of the process window occurs by undesirable cross-linking in the resist system, even at high doses of exposure. .
