Abstract (en)

[origin: WO2004032216A1] The invention relates to a semi-conductor component having a layer containing silicon and a praseodymium oxide layer, whereon a mixed oxide layer containing silicon, praseodymium and oxygen is arranged between the silicon layer and the praseodymium oxide layer. The layer has a maximum thickness of 5 nanometers. The invention also relates to a method for producing one such semi-conductor component. With the aid of the mixed oxide layer, which contains a silicon oxide intermediate layer, the capacity of the component can be improved in relation to components known per se. High charge carrier movement is also obtained without the need for a silicon oxide intermediate layer.
