Abstract (en)  
[origin: WO2004025295A2] The present invention relates to a microscopy system for rapid and sensitive detection and identification of biological material on surfaces by implementing episcopic differential contrast (EDIC) microscopy plus epifluorescence (EF) microscopy wherein the microscope incorporates a DIC prism in the nosepiece and long distance objectives so that the materials can be visualised without requirement for a coverslip or oil or water immersion. The system is particularly useful for the detection and identification of infectious diseases.
