Abstract (en)

A DAB broadcasting receiver is provided which can easily tune in a service contained in an ensemble other than an ensemble now in reception. In the DAB broadcasting receiver of this invention, when the receiver is turned on or in response to other events, information of services contained in the ensemble now in reception is acquired, all ensembles of DAB broadcasting in a predetermined frequency range are actually received one after another (S13 - S23), and a list of services contained in one of the ensembles is stored in a memory 37. When a user tunes in a reception channel, the list of services contained in one of the ensembles is read from the first memory 37 and displayed on a display means. The user can easily tune in by selecting a desired service from the displayed service list. <IMAGE>
