Abstract (en)

[origin: WO2004019750A1] The present invention relates to a method and a device for the adaptive drying of heated goods in a household machine (1) by means of expelling present humid air from the washing area (2), where the expulsion of the humid air is first initiated, and the ambient humidity content is then detected, which results in a first value. This first value of the humidity content is stored following which the humidity content of the expelled air is detected, which expelled air continuously has a lower and lower value of the humidity content. The drying process is interrupted when the value of the humidity content of this expelled air reaches a value which has a predetermined relationship to the stored first value of the humidity content of the ambience.
