Abstract (en)

[origin: US2004074025A1] A hand held cleaning tool is powered by commonly available batteries. An output shaft of the tool includes an expandable coupling, such as, for example a set of swaging cams. Torque delivery arms radiate outward from the output shaft. For example, the torque delivery arms are carried by a hub. The hub is attached to the output shaft with a pin and acts to secure a power train to a housing of the tool. The torque delivery arms are received in slots or interdental spaces associated with a cleaning head. Torque is delivered to the cleaning head with a reduced stress concentration. The cleaning tool is associated with a compact stand. The stand can be incorporated into a housing of the tool. For example, a battery compartment door can include the stand. Alternatively, the stand can be a separable item. A separable stand can accommodate a plurality of cleaning heads.
