Abstract (en)

[origin: WO2004035315A2] Disclosed is a device for guiding a continuous web (10), said continuous web (10) being directed about a given angle of wrap via two rolls (24, 26). The shafts of said rolls (24, 26) lie parallel on one plane and are held by a frame (28) which can be swiveled about a first axis of rotation (30) so as to modify the position of the edge (11, 13) of the web (10) in the direction of the roll shafts. The frame can also be swiveled about a second axis of rotation (58), one component of which runs parallel to the direction of movement of the web (10) between the two rolls (24, 26).
