Abstract (en)
[origin: WO2004036449A1] A method for managing metadata in a metadata transmission server is provided. The method involves generating a plurality of fragment data by partitioning metadata to be transmitted on the basis of a predetermined segment unit, selecting predetermined fragment data among the plurality of fragment data, generating metadata-related information using the selected fragment data, and transmitting the selected fragment data and the metadata-related information with data format information indicating the type of the selected fragment data.
