Abstract (en)
[origin: WO2004034554A1] Disclosed is a coiling machine (20) comprising a support device (23) for winding a coil used for an electric machine. Said support device (23) is provided with at least one group (34) consisting of a coil former (29) and an adjacent redirecting element (31) which are movable towards each other. Also disclosed is a method for producing a winding comprising at least one coil, according to which at least one wire is wound around a coil former (29) such that at least one wire arrangement comprising at least one first coil face (68), at least one first redirecting face (69), and at least one second coil (70) is created, a coil former (29) being displaced from a plane for winding purposes.
